motors

TECHNICAL
CATALOGUE

Volt Motors is a subsidiary of the Saya Group, a privately held Turkish conglomerate with interests in real estate development, tooling and molding, pharmaceuticals, mining and low-voltage industrial motor manufacturing.

We manufacture the highest quality electric motors, designed and produced in a modern facility utilizing highly trained personnel and the latest manufacturing equipment. We not only operate cost efficiently but also in an environmentally responsible manner.

Our recent expansion into international markets has led to a new management philosophy based on international standards in administration and customer support. Our new International Development Strategy fosters an environment of not only quality and service, but also the international perspective and the professionalism necessary to support our partners worldwide. This approach has led to successful partnerships with several large OEMs and distributors in the Middle East and Europe and was the strategy behind the establishment of Volt Electric Motors B.V. in The Netherlands with warehouse, sales and the technical support capacity required in the European market.

frame sizes

from **63**

to **315**

IE1 IE2 IE3 IE4

General purpose motors can be produced as 2-4-6 poles, 380 and 400V/50Hz for three-phase and 220V/50Hz and 230V/50Hz for single-phase. Special motors with special shafts, multi-speeds, various voltages and frequencies can be produced according to customer's requests.

Aluminum and cast iron frames are between 63-315, 0,12 kW - 200 kW. (Aluminum frame: 63 - 180. Cast iron frame: 160-315).

Their manufacturing and installation systems are IM B3, IM B5, IM B14 and B3/B5 (B35) and B3/B14 (B34) combined system format according to IEC 60034-7. Motors can also operate in vertical and appropriate installation positions.

Efficiency Class	: IE4, IE3, IE2, IE1
Cooling system	: IC411
Operation Type	: S1
Protection Class	: IP55
Working Height	: Maximum 1000 meters
Isolation class	: F
Temperature increase class	: B
Maximum ambient temperature for working	: 40°C

PTC thermistors in the windings are embedded in frame sizes 180 and bigger. PTC thermistors can be used in smaller sizes according to customer's request.

The voltages and frequencies for 2 and 4-pole, three-phase motors up to 3 kW and 6-pole, three-phase

motors up to 2,2 kW are 230 230VD/400VY 50 Hz. The voltages and frequencies for 2 and 4-pole, three-phase motors over 3 kW and 6-pole, three-phase motors over 2,2 kW are 400 VD/690VY 50 Hz.

Terminal boxes are made from aluminum alloy for three-phase motors and thermoplastic materials with capacitor slots for single-phase motors.

The standard position of the terminal box is on the upper part of the motors. Terminal boxes include six terminals for motor power supply. Grounding connection takes place in the terminal box. Additionally, there is a grounding connection in the motor frame.

Noise level is within IEC 60034-9 Standard.

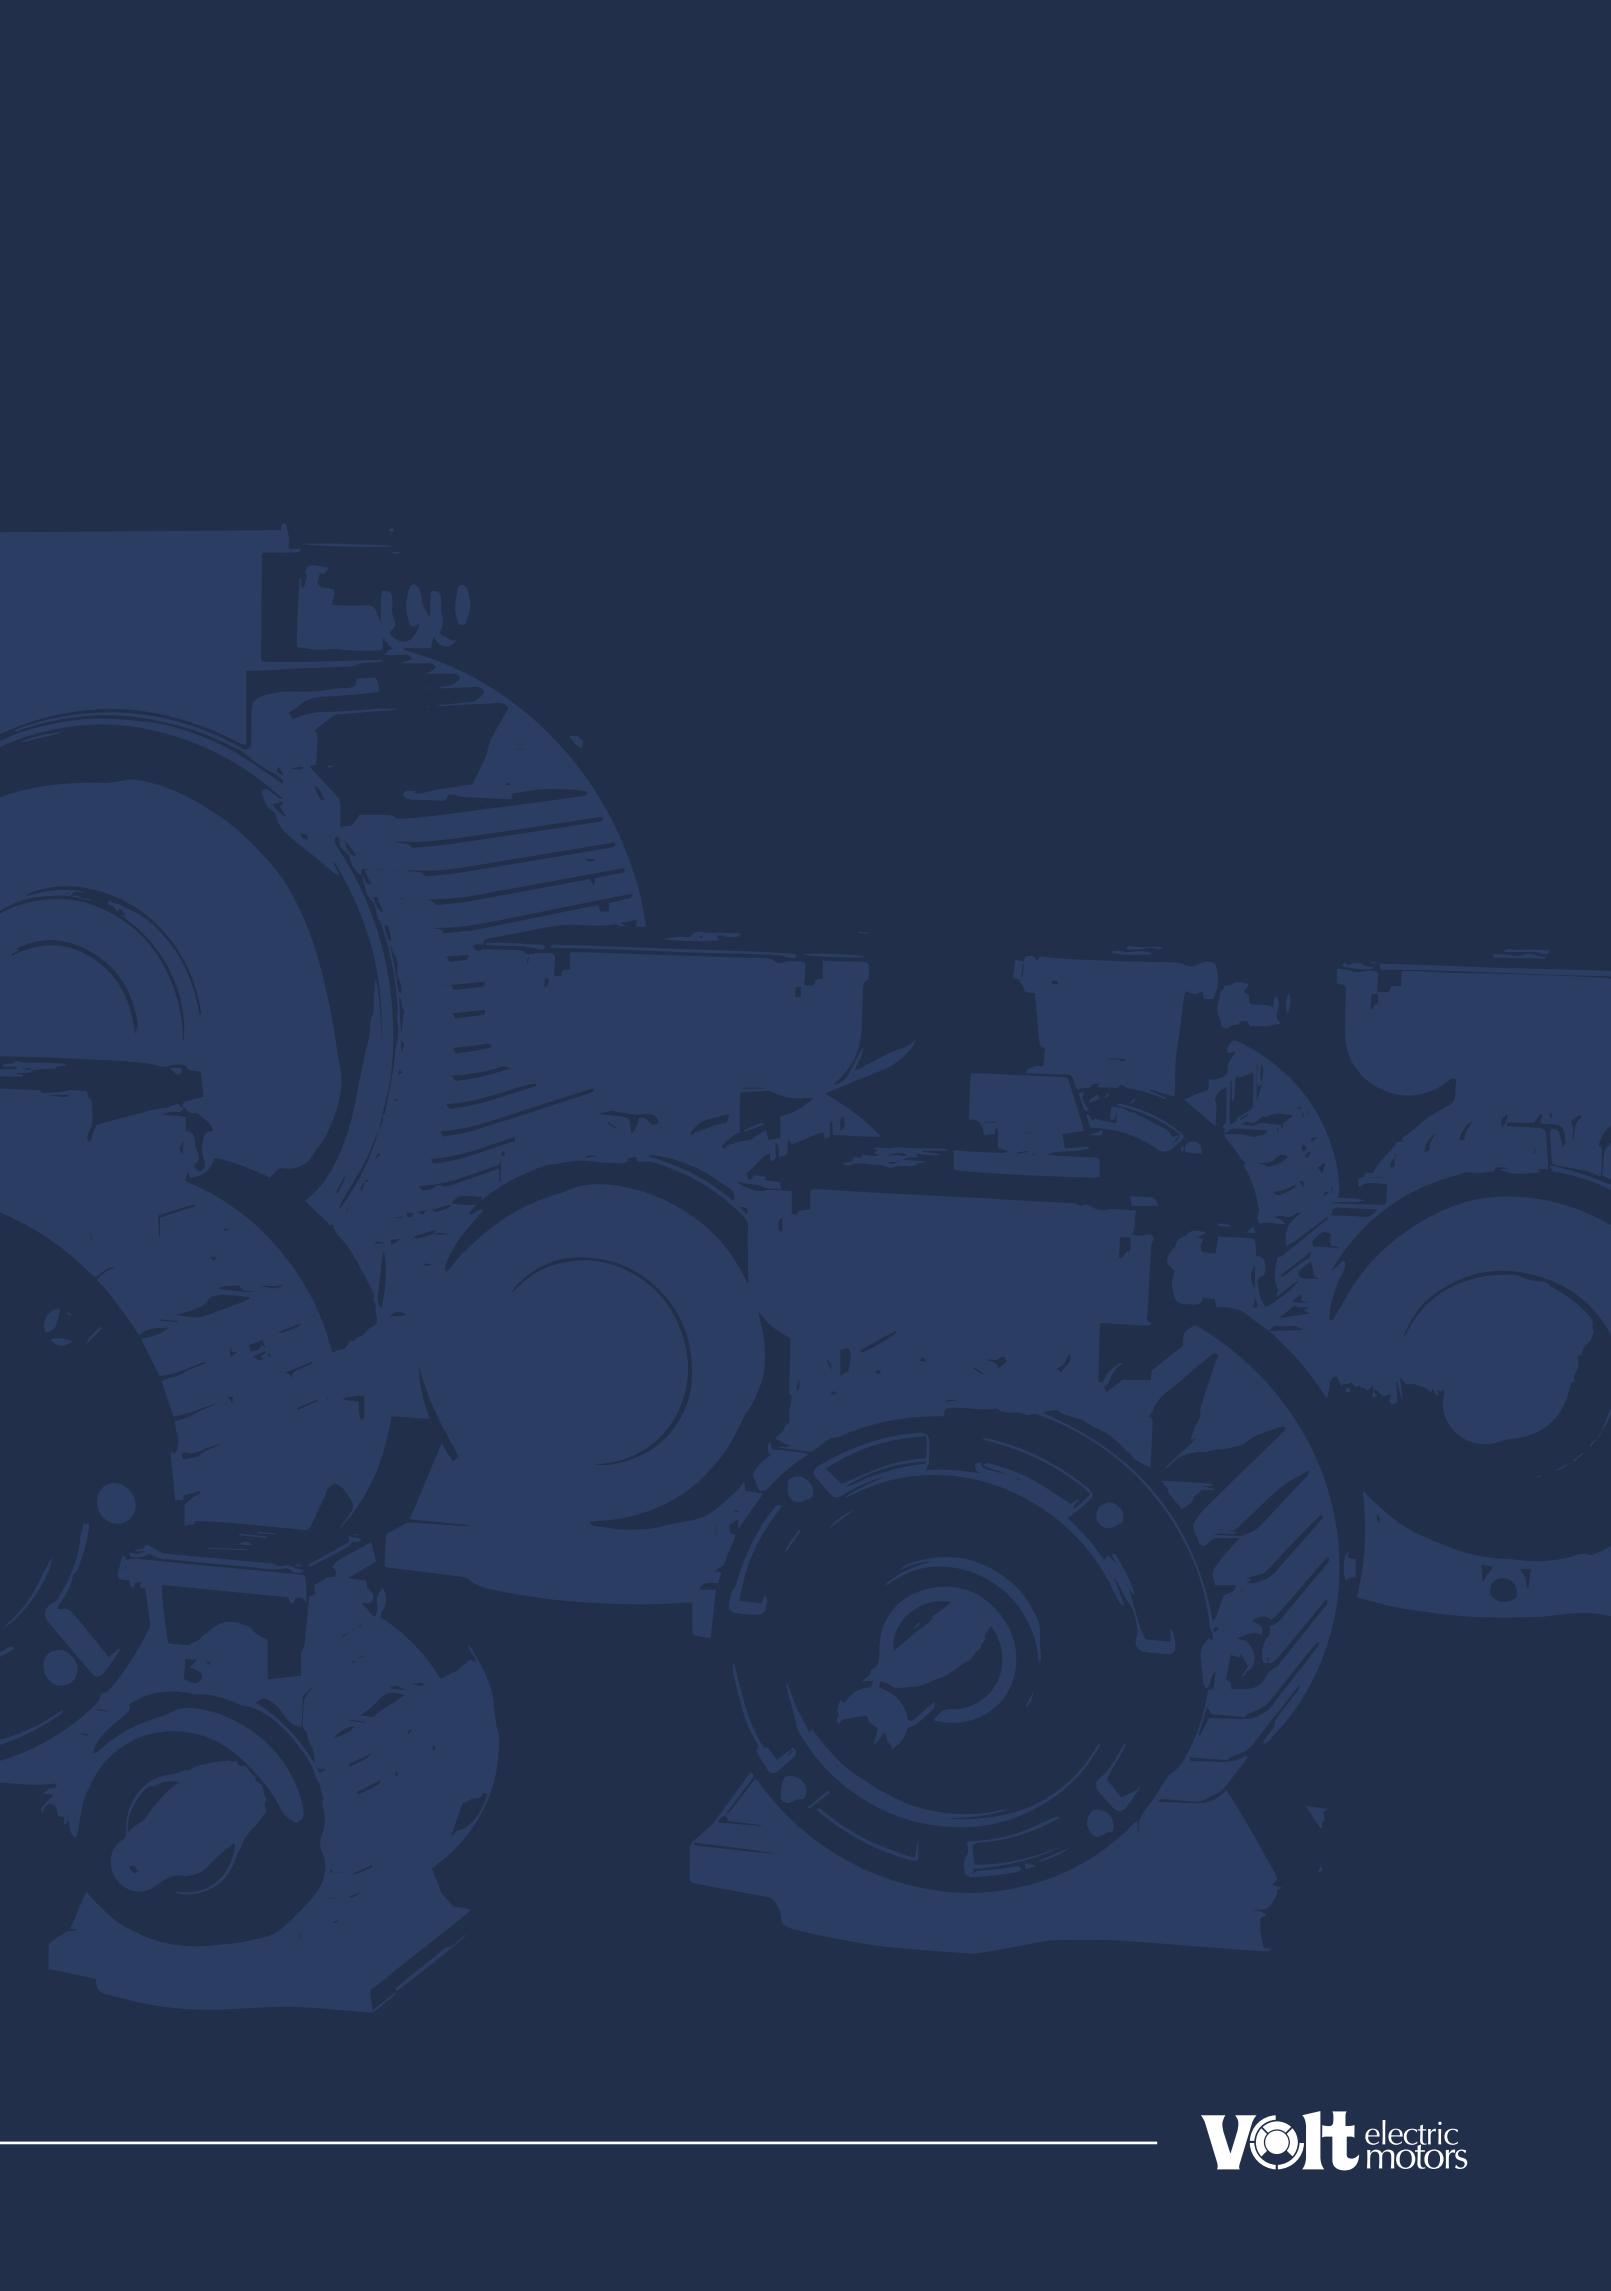

Vibration intensity level is 'Normal' class according to 60034-14.

RAL 7031, gray colored, with single-component synthetic painting is standard and suitable for industrial environments. Upon customer's request different applications are possible.

VSD compatible motors can be produced upon customer's request.

TABLE 1: Standards and Recommendations.

EFFICIENCY CLASSIFICATION in LOW-VOLTAGE MOTORS ACCORDING TO IEC 60034-30

IEC/EN 60034-34 has been published by IEC in October of 2008. Its purpose is to eliminate the numerous different energy standards used for cage-induction motors and to create a single description for low-voltage motors efficiencies to be used globally.

These efficiency classes are:

- Premium efficiency IE3
- High efficiency IE2
- Standard efficiency IE1

IE4 class was defined in IEC 60034-30:2008 for asynchronous and synchronous motors. 15% more efficiency was aimed with respect to IE3 motors. Innovations in cage rotor designs and material technology were requested for providing IE4 efficiency. During a review of standards, this application could be added to the system at a later time.

It has a wider coverage compared to the previous standard. The standard covers most kinds of motors (i.e. general purpose standard motors, motors designed for explosive areas, marine motors and motors with reducers and brakes).

Properties of IE2 motors covered by this standard are:

- Three-phase, single-speed asynchronous motors; 50 Hz and 60 Hz
- Motors with power between 0.75kW and 375kW
- 2, 4 and 6-pole motors
- Motors with rated voltage up to 1000V
- Operation type S1 and operation period 80% and over S3
- Motors operating directly with delta connection

Following motors are excluded from standard are:

- Motors used with speed control devices
- Motors that cannot be tested without the appliances they are used for (i.e. pumps, fans and compressors)

Efficiency Classes:

Efficiency classes defined in IEC 60034-30 standard have entered into force in 2008 by IEC. Comparable efficiency levels are displayed in Figure 1.

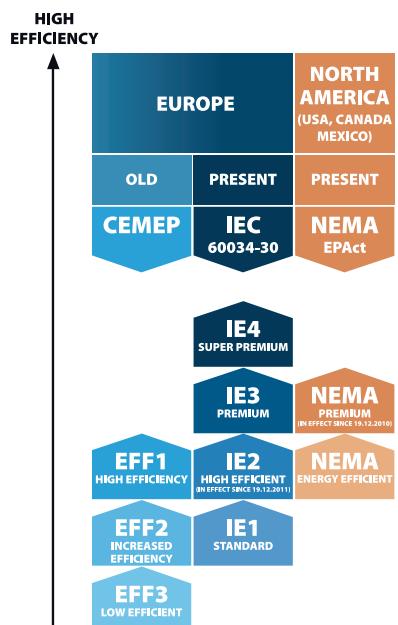

FIGURE 1: Efficiency classes defined in IEC 60034-30 standard and their comparable efficiency levels

APPLICATION CALENDAR

Efficiency application calendar shall be applied as in Figure 2.

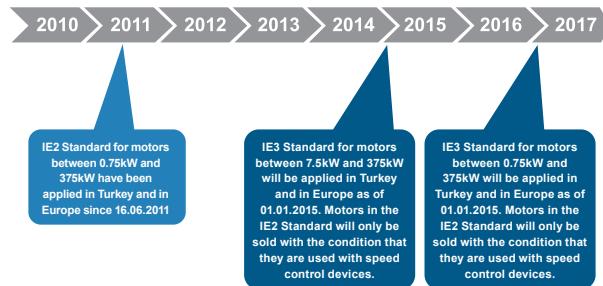

FIGURE 2: Efficiency Application Calendar

According to this calendar:

- Motors between 0.75kW and 375kW that are in the IE1 (EFF2 and EFF3) efficiency class and do not correspond with the IEC 60034-30 cannot be sold in Europe and Turkey as of 2010.
- Provided that motors between 7.5kW and 375kW are not launched with VDF (Variable Frequency Drives), they should have IE3 energy efficiency. IE2 energy efficiency motors between 7.5kW and 375kW cannot be sold if they were launched with VFD.
- As of 2017, the same provision will be expanded and applied for the motors between 0.75kW and 375kW.

Efficiency standards prepared by IEC:

The standards formed by IEC to test energy efficiencies and performances are as following:

- Development studies formed by IEC to standardize the special test methods for AC motor efficiencies and losses, supplied by Variable Frequency Drives, still continue.
- Motors produced according to the IEC 60034-30 efficiency standard should be tested again according to the IEC 60031-2-1 test standards published by IEC in September, 2007.

ASYNCHRONOUS MOTOR LOSSES

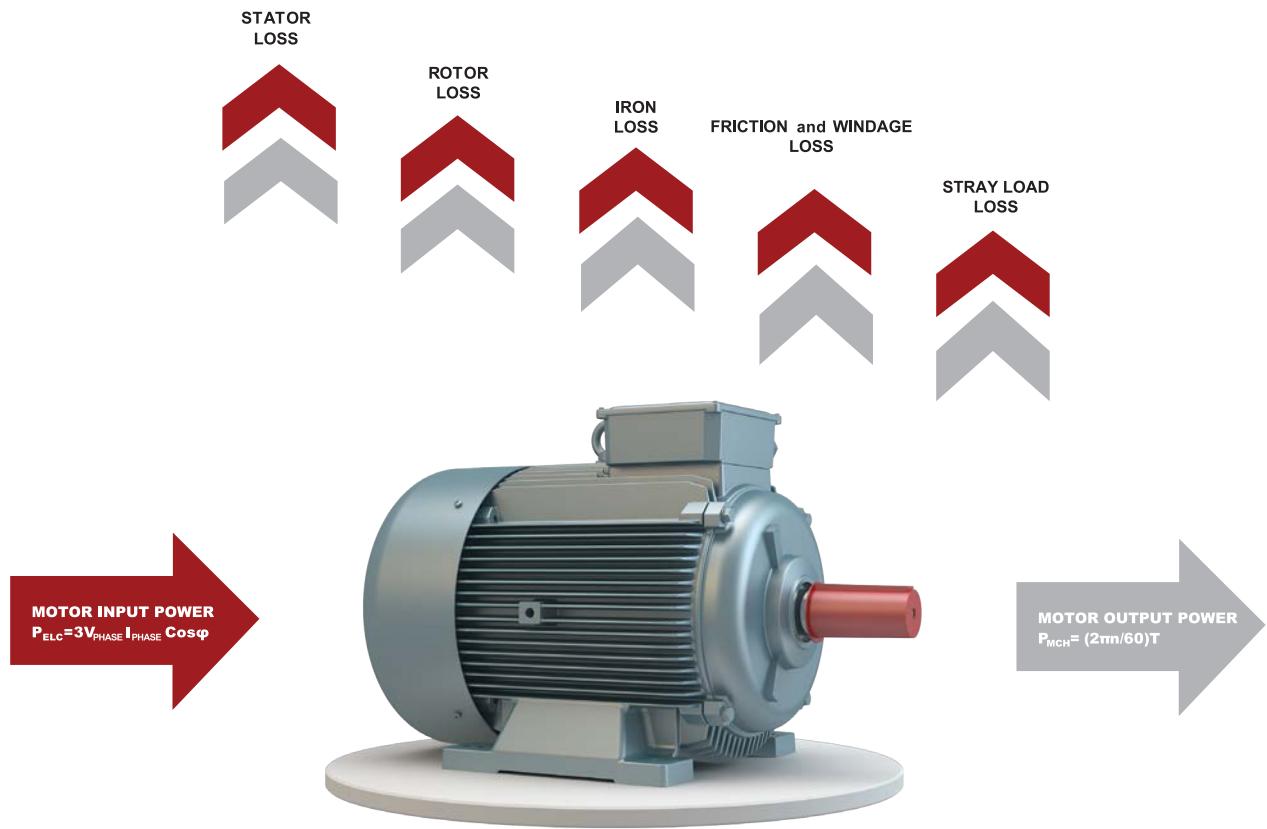

FIGURE 9: Asynchronous Motor Losses

Motor efficiency was calculated based on the previous EN/IEC 60034-2-1996 standard using the following methods:

- Direct method
- Indirect method
- PLL (additional losses) is considered as 0,5% of motor input power

Resistance losses in stator and rotor winding and wound rotor motors are defined according to 95°C temperature.

Motor efficiency calculation according to the new IEC/EN 60034-2-1-2007 standard is calculated as follows:

- Direct method
- Indirect method
- PLL (additional losses) is calculated with three separate methods that can be selected by producer's preference
- Calculated based on load tests performed in different voltages and loads
- Considered as 2,5%-1,0% of motor input power at rated power for the motors between 0,1-1000kW
- Alternatively it can be determined with an indirect calculation method. Once values at ambient temperature 25°C (or real ambient temperature value) or the values obtained after winding temperature has been reached, the thermal stability in motor thermal tests can be used for stator and rotor wound motors resistance calculation.

Since additional losses are more sensitively measured with special methods and calculation, it is considered that additional losses are more than 0,5% of input power. Calculated efficiency with respect to the new standard can be lower than efficiency, which is calculated according the previous standard.

Efficiency values in IEC 60034-2-1:2007 standard are recalculated and are declared in IEC 60034-30 standard in IE1, IE2 and IE3 efficiency classes. These declaration values are given in tables (Table 2 and Table 3) and in graphics (Figure: 3-8).

DUTY TYPES

S1

Continuous running duty

Motor operates under fixed load until reaching heat balance. Without indications of the type of rated motor, S1 continuous running duty should be assumed. This is used in pump, fan, ventilation, and compressor applications.

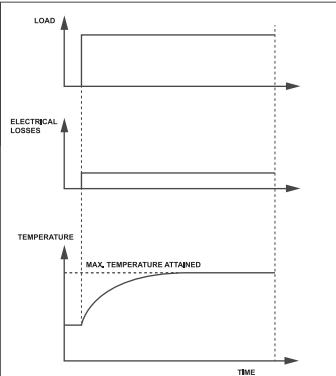

FIGURE 10: S-1 DUTY TYPE - Continuous running duty

S2

Short time duty

Motor operates under fixed load without reaching the heat balance. Motor cools down to ambient temperature in stop times. Operation time is recommended as 10, 30, 60 and 90 minutes. Dam covers, sirens and some cranes can be seen as examples of application.

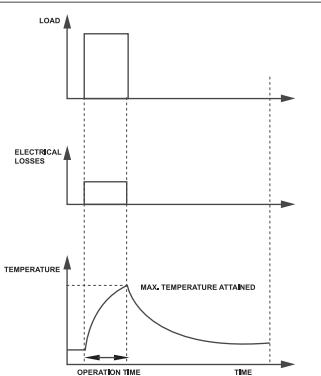

FIGURE 11: S-2 DUTY TYPE - Short-time duty

S3

Intermittent periodic duty not affected by the starting process

Operation periods are composed of a fixed load operation with a proceeding stop. Starting current does not cause temperature increase. Unless otherwise specified operation period is 10 minutes. Relative operation period can be 15%, 25%, 40% and 60% of the period. Motor valve systems and wire pulling machines are classified in S3 operation type.

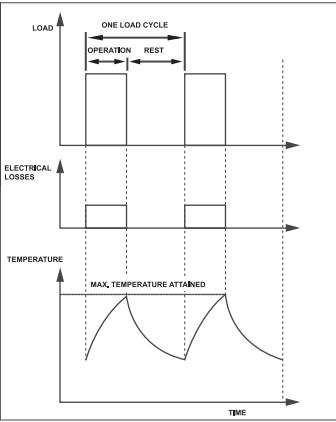

FIGURE 12: S-3 DUTY TYPE - Intermittent periodic duty

S4

Intermittent periodic duty affected by the starting process

This system is composed of identical operation period series. Each period has long starts, operating under a fixed load with stop periods that are not negligible. Due to very short operation periods, thermal balance cannot be reached. Overhead cranes, typical cranes, and elevators are examples of these types of applications.

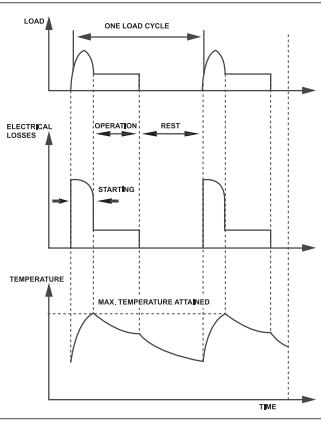

FIGURE 13: S-4 DUTY TYPE – Intermittent periodic duty with starting process

S5

Intermittent periodic duty affected by the starting process and by electric braking

This system is composed of an identical operation period series. Each period is composed of long starts, operating under a fixed load with instantaneous electrical braking and stop periods that are not negligible.

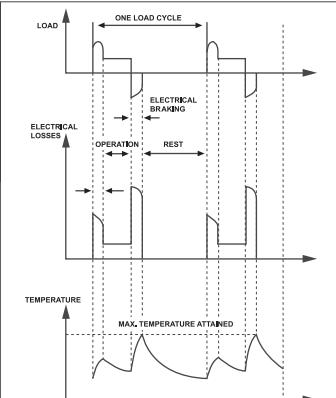

FIGURE 14: S-5 DUTY TYPE - Intermittent periodic duty with electric braking

S6

Continuous operation, periodic duty with intermittent load

This system is composed of an identical operation period series. Each period consists of two parts: one is operation under fixed load and the other is unloaded operation. Due to very short operation periods, thermal balance cannot be reached. Unless otherwise determined operation period is 10 minutes. Relative operation periods can be 15%, 25%, 40% and 60% of the period. Conveyors, machine tools and hand tools are covered in S6 operation type.

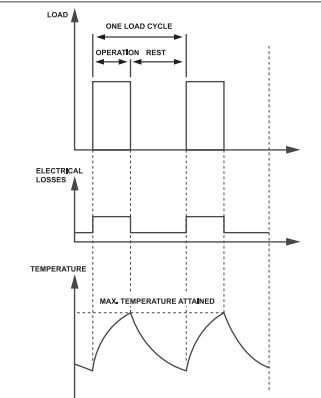

FIGURE 15: S-6 DUTY TYPE – Continuous operation duty with intermittent load

S7

Uninterrupted periodic duty, affected by the starting process and electric braking

This system comprises of a sequence of identical duty cycles. Each cycle has a period of starting current, a period of operation at constant load, and a period of electrical braking. The braking method is too short for thermal equilibrium to be obtained.

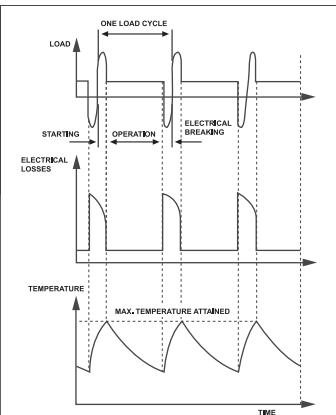

FIGURE 16: S-7 DUTY TYPE – Continuous operation periodic duty with electric braking

S8

Uninterrupted periodic duty with recurring speed and load changes

This system is a sequence of identical duty cycles, each period comprises of a period of operation at constant load (corresponding to a predetermined speed of rotation), and one or more periods of operation at other loads (corresponding to different speeds of rotation). The period of the duty cycle is too short for thermal equilibrium to be obtained. This type of duty cycle is used for pole changing motors. Applications which require different loads and different speeds are covered in S8 type operation

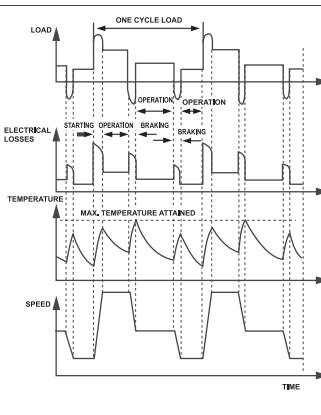

FIGURE 17: S-8 DUTY TYPE – Continuous operation periodic duty with related load/speed changes

PROTECTION CLASSES

Our motors are manufactured according to the IEC 60034-5 standard, protecting them against dust and squirting liquids. Our standard motors are manufactured in IP 55 protection class. IP56, IP65 and IP66 are available upon request.

As shown in Table 4, the first digit in the IP (Ingress Progress) diagram describes the protection against solid materials. The second digit shows the protection against liquid materials.

IP	5	5	
Protection Against Solid Materials	First Number	Second Number	Protection Against Liquid Materials
Unprotected	0	0	Unprotected
Protection against objects greater than 50 mm	1	1	Protection against water coming vertically
Protection against objects greater than 12 mm	2	2	Protection against water coming vertically up to 15 ° angle
Protection against objects greater than 2.5 mm	3	3	Protection against water coming vertically up to 60 ° angle
Protection against objects greater than 1 mm	4	4	Protection against water splashing from all directions
Protection against dust	5	5	Protection against water squirting from all directions
Complete protection against dust	6	6	Protection against powerful water squirting from all directions
	0	7	Protection against temporary water submersion between 0.15m and 1m
	0	8	Protection against permanent water submersion

TABLE 4: Protection Classes

MAIN COOLING TYPES ACCORDING TO IEC 60034-6

COOLING TYPE

The aim of cooling is to transfer the heat from the motor to ambient. The objective is to keep the temperature of isolation materials under the limit values.

The cooling type in Electrical Machines are determined with numbers between "1-9" that come after 'IC' (International Cooling), code letters according to the IEC 60034-6 standard.

Cooling air is supplied by a plastic fan which is connected to the motor shaft and operates inside a holed steel sheet protection cover; cooling is performed outside of the completely closed surface of the motor. Since Volt Electric motors are cooled with a fan from a completely closed outside surface, their cooling type is IC 411. IC 418 cooling type can also be manufactured upon special requests. Commonly used cooling examples for IEC 60034-6 standard are given in following Figure 18.

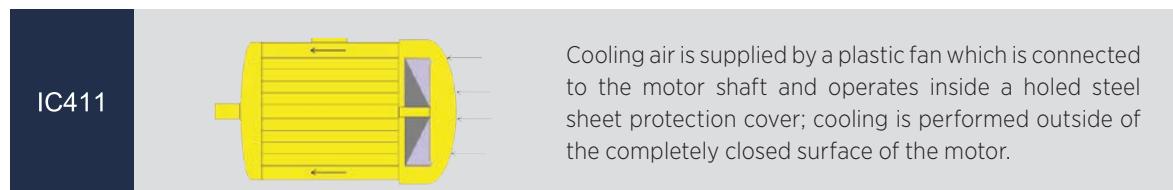

FIGURE 18: Main Cooling Types According to IEC 60034-6

CONSTRUCTION FORMATS and INSTALLATION SYSTEMS

Asynchronous motors have standardized feet height (H) dimensions from base to shaft. This dimension defines the construction size of the motor. Dimension B measures the length (S, M, L) of the frame size.

S - Short size frame length

M - Medium size frame length

L - Large size frame length

Standardized construction sizes and standardized frame sizes are shown according to IEC 60072-1 and EN 50347 standards. Construction sizes and corresponding (H) axis heights are given in following table.

IEC Construction Sizes H (mm)							
56	63	71	80	90	100	112	
132	160	180	200	225	250	280	
315	355	400	450	500	560	630	
710	800	900	1000	1120	1250	1400	

Three-phase Volt Electric Motors are produced in: 63 - 71 - 80 - 90S - 90L - 100 - 112 - 132S - 132M - 160M - 160L - 180M - 180L - 200L - 225S - 225M - 250M - 280S - 280M - 315S - 315M - 315L construction sizes.

TABLE 5: IEC Construction Sizes

Powers and axial heights (frame sizes) and some external dimensions are standardized in asynchronous motors. Changeability and new project studies have become easier by means of this standardization. Specifying motor operational voltage, power, revolution speed, frame size, protection type and construction type is necessary for new motor orders.

Six basic standardized dimensions of asynchronous motors based on IEC 60072-1 are as follows:

1. H (frame size or construction size)
2. Longitudinal and latitudinal distances of fixing holes A, B
3. Distance between shaft rabbet and nearest foot's fixing hole C
4. Shaft end diameter, D
5. Length of shaft extension beginning from shaft rabbet, E
6. Fixing hole diameter, K

F: Key slot width

GD: Key thickness GD

GE: Key slot depth

GA: The distance between top of wedge and shaft's other surface in the axis is GA.

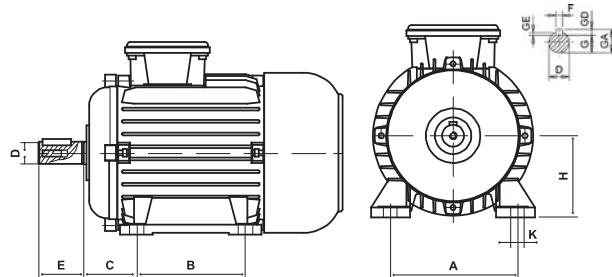

FIGURE 68: Asynchronous motor frame sizes

EN 50347 provides standardized dimensions, key and key slot dimensions, power values and standard flange dimensions for flanged motors.

Construction Types (IM):

Construction types and installation systems are standardized according to IEC 60034-7.

There are main five construction types:

1. Foot type
2. Foot and flanged type (B35 and B34)
3. Without foot flanged type (B5 and B14)
4. Foot and without front cover type (B15)
5. Without foot and without front cover type (B9)

Mainly used types are: foot type, foot and flanged type and without foot flanged type. Symbolization of this part is formed by two separate coding.

Classifications of motor construction types and installation systems have been done in IEC 60034-7 and abbreviated as IM (International Mounting).

Code I: This part solely covers motors which are embedded from side covers only and single shaft prominent motors. The letter B corresponds to horizontal shaft motors and V letter corresponds to vertically-installed motors. These types of motors (embedded from side covers and single shaft prominent) are shown with numbers following the letter B or V.

Code II: This part covers all electrical motors designed for general and special purposes. They are classified with four numbers following the letters IM. Numbers are defined as following:

- 1 = Class of construction type class
- 2 and 3 = Installation systems
- 4 = Shaft extension

STANDARD ROTATION DIRECTION

When you look at the motor shaft (the front side, drive-D) the clockwise rotation is the standard motor rotation direction. The rotation direction can be changed by changing two phases.

FIGURE 19: Motor rotation direction

CONNECTIONS and TERMINAL MARKINGS OF ASYNCHRONOUS MOTORS

Item No	Description	Symbols According to IEC 60034-8
1	Three-phase network	L1 - L2 - L3
2	Three-phase and single-phase network neutral line	N
3	Single Phase network	L - N
4	Single-phase, single-speed Stator winding (6 connection terminal)	Input U1 - U2 V1 - V2 W1 - W2 Output
5	Three-phase, single-speed stator winding (3 connection terminal)	U - V - W
6	Single-phase motor winding • Main winding • Auxiliary winding	U1 - U2 Z1 - Z2
7	Three-phase, two-speed Dahlander winding Low Speed High Speed	1U - 1V - 1W Low 2U - 2V - 2W High
8	Three-phase, two-speed PAM winding Or two separate windings (e.g. for 8/6 poles) Low speed High speed	For 6/8 poles ; 8U - 8V - 8W 6U - 6V - 6W
9	Three-phase motor winding (3 connection terminals)	K - L - M

TABLE 6: Marking of connection terminals for Asynchronous motors

Connection Terminal Marking:

Terminals are marked with standard symbols to make connections in electrical machines easier and more accurate. Volt Electric Motors uses markings according to IEC 60034-8, as shown in Table 6.

SURFACE SOUND PRESSURE LEVEL LpA dB(A)

FRAME SIZE	6 POLES		4 POLES		2 POLES

TABLE 7: Sound pressure levels per frame size

NOISE LIMITS ACCORDING TO IEC 60034-9

Noise level limits for general purpose electrical machines are determined in IEC 60034-9. Permitted unloaded operation sound level and A-sound power level L WA limit values in operation at rated power are given in Table 7 and Table 8. The relationship between LWA and surface sound pressure level LPA is $L_{PA} = L_{WA} - 10 \log \left(\frac{S}{S_0} \right)$

Here;

L_{PA} = Sound pressure level in free area over reflection plane whose distance is 1 m with motor surface

L_{WA} = Determined sound power level that is determined according to this standard

S_0 = 1 m² (Reference area)

S = Area of measurement surface

As seen in Table 7, 8 and Table 9 noise levels of Volt Electric motors are very low with respect to the standard limit values. The average sound pressure measurements, made in different locations with 1m distance to the LpA motor surface in terms of dB (A) unit, are given in Table 7-9.

SOUND POWER LEVEL L_{WA} (dB) AT UNLOADED OPERATION ACCORDING TO IEC 60034-9

MOTOR OUTPUT POWER P_N kW	8 poles		6 poles		4 poles		2 poles

ISOLATION CLASSES

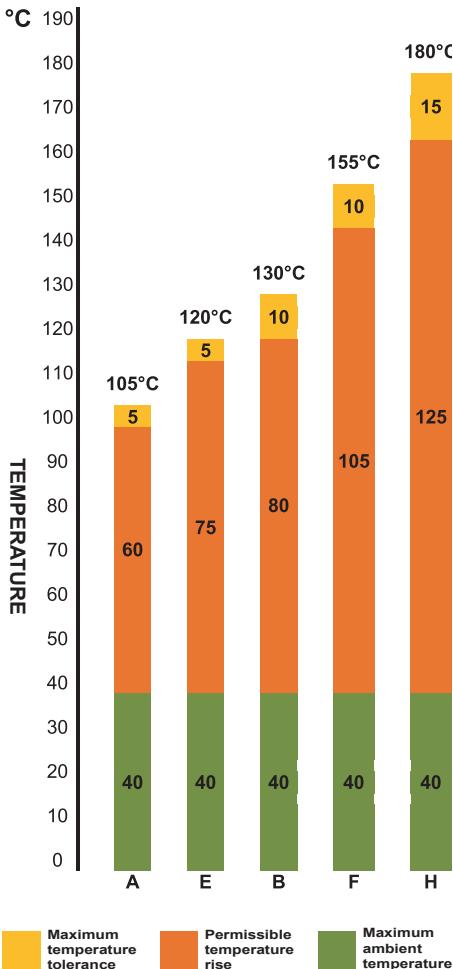

FIGURE 20: Isolation classes chart

Maximum Values that are permitted	Unit	Isolation Class				
		A	E	B	F	H
Total winding temperature	($t_{ambient} + \Delta t + t_{tolerance}$)	°C	105	120	130	155
Winding temperature increase	(Δt)	K	60	75	80	105
Ambient Temperature	($t_{ambient}$)	°C	40	40	40	40
Tolerance	($t_{tolerance}$)	K	5	5	10	10
						15

TABLE 10: Isolation classes

The temperature rise limit of Volt Electric motors is in class B. Stator windings are composed of copper conductors which are plated by double-layered enamel in class H. In phase windings (in each channel and in each winding start) and winding heads, complete isolation is provided by Lacquer absorption method which is high qualified and in class H (total 180 °C). Other isolation materials are also in class H. This enables a winding construction to stand up to 155 °C.

The classification of isolation materials based on their standing temperature are shown in Table 10.

There are also Y, 200, 220, 250 isolation classes according to IEC 60085. Y class defines 90 °C temperature limit, 200 class defines 200 °C limit, 220 class defines 220 °C limit and 250 class defines 250 °C temperature limit.

A graphical representation of above mentioned are shown in Figure 20.

VIBRATION LIMITS ACCORDING TO IEC 60034-14

Vibration Grade	Shaft Height (mm)	56 ≤ H ≤ 132			132 < H ≤ 280			H > 280		
		Mounting	Displac. μm	Vel. mm/s	Acc. m/s²	Displac. μm	Vel. mm/s	Acc. m/s²	Displac. μm	Vel. mm/s
A	Free Suspension	25	1,6	2,5	35	2,2	3,5	45	2,8	4,4
	Rigid Mounting	21	1,3	2,0	29	1,8	2,8	37	2,3	3,6
B	Free Suspension	11	0,7	1,1	18	1,1	1,7	29	1,8	2,8
	Rigid Mounting	-	-	-	14	0,9	1,4	24	1,5	2,4

TABLE 11: Vibration Limits according to IEC 60034-14

Grade "A" applies to machines with no special vibration requirements.

Grade "B" applies to machines with special vibration requirements. Rigid mounting is not considered acceptable for machines with shaft heights less than 132 mm. The interface frequencies for displacement/velocity and velocity/acceleration are 10 Hz and 250 Hz respectively.

VIBRATION LIMITS ACCORDING TO IEC 60034-14

Permitted vibration densities are determined in IEC 60034-14 standards and these values which are given in Table 11 are recommended as upper limit values for motor producers. Three separate vibration density levels are determined according to this standard. Vibration levels of Volt Electric motors are within normal limits and meet the standard provisions. All our rotors are dynamically balanced by half key.

Duty types:

Duty type is an operational program that covers unloaded operation and stop period; and the load applying order and periods.

Operation regime type is the operation system that does not change one or more loads for a definite time period. Electrical motors are manufactured according to operational conditions. Standard operational duty types are classified according to IEC 60034-1.

WORKING CONDITIONS

Volt Electric Motors are manufactured to operate continuously at rated power in S1 duty type at 40°C ambient temperature and at an altitude up to 1000 m. Since motor performance will decrease at values which exceed these temperature and altitude values, the motor rated power should be decreased.

Temperature Controlled Protection Equipments:

Motor protection is achieved with fuses thermal relays, thermal magnetic circuit breakers and thermistors. Fuses protect motor, cable, relays circuit breakers and soft starters and speed controlling devices as well as; against short circuits however they cannot protect motors against overloading and over warming. Thermal relays and thermal magnetic circuit breakers are adjusted according to the rated current of motor they protect the motor by cutting the circuit against overloading and over current. However, other factors out of overloading and over current can cause damages to motor. Operation at two phase; decreasing or stop at cooling air; exceeding ambient temperature and unstable ambient conditions (e.g. environment where thermal relay exist can be cool and environment where motor exists can be hot) to operation at high altitudes; over start/stop; longer starting; and braking and similar situations; can cause winding temperature to increase up to permitted temperatures and thermal relays may not provide protection. In explained and similar situations increase in temperature more than set forth values should not be permitted. The most reliable protection for these cases is temperature-controlled protection.

Generally two types of protection equipment are used in temperature-controlled protection:

- Bi-metal circuit breakers (Micro thermostats)
- Semi-conductor temperature sensors (PTC Thermistors)

Micro Thermostats:

They are serial-connected b-imetal circuit breakers that include two or three elements. They open the circuit during over limit temperatures and are closed during under limit temperatures. They have NC (Normally Closed) and NO (Normally Opened) types. Micro thermostats are selected according to motor insulation class and maximum temperature limits which are permitted for windings, and are placed inside stator phase windings. Thermostat terminals are brought into motor terminal table and one type of thermostat is used for motors for all power classes.

Micro thermostat protection thermals are serially connected to contactor coil circuit, which controls motor energy contactor. If the temperature in the motor windings exceeds limit value the bi-metal circuit breaker is opened. Since the thermostat circuit is serially connected to motor

energy, the contactor coil circuit energy contactor opens and the motor will stop.

Volt Electric installs micro thermostat equipment into motor windings upon the request of customers. These types of motors are ready for temperature controlled protection.

PTC (PositiveTemperatureCoefficient) Thermistor and Relay:

PTC thermistors are sets with serially-connected, three components and a relay. They are semi-conductor temperature-sensitive equipment. Their electrical resistances increase according to certain temperature values. Temperature value where their resistance suddenly increases is called Nominal Response Temperature (NAT). Nominal Response Temperature should be selected according to motor's insulation class and permitted temperature value of the motor being protected. There is one type of thermistor and relay for all kinds of motors at all power, which is efficient for motors with greaser power. PTC thermistor elements as sets are installed into motor's stator windings. PTC relay is installed in the motor control cabinet. Relay connections can be different according to producers. Relay controls motor energy contactor. Thermistor elements provides an alarm signal for the relay when temperature is close to limit temperature as well as trip signal at the permitted limit temperature. The relay operates when it receives a trip signal and opens the energy contactor. Therefore they protect windings from blowing out during situations such as sudden over current increasesand sudden over voltage changes.

Volt Electric uses total of 3 PTC thermistors in each of the three-phase stator windings, one-by-one , in motor frame sizes 180 and up. PTC thermistors and bi-metal thermostats can be used in smaller size frames according to customer's requests.

MOTORS with VSD USAGE

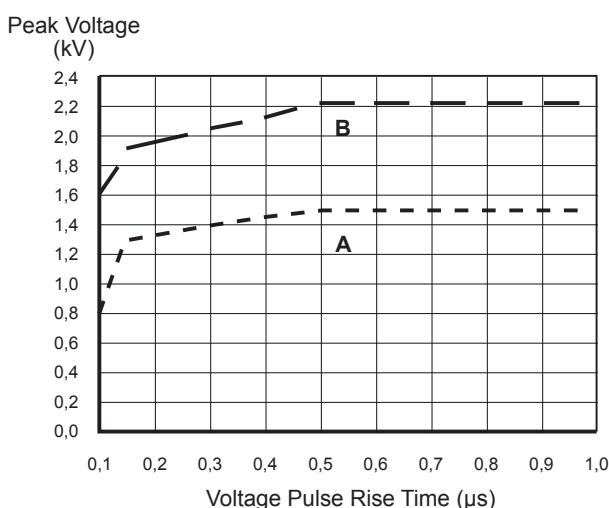

- High Frequency Switching (PWM frequency): PWM is aimed to have a sinusoidal wave at motor terminals by firing rapid voltage pulses.
- Short Rise Time: Related to the PWM frequency, voltage at motor terminals changes in very short time between high and low values (high $\Delta U/\Delta t$ rate).
- Transient Voltage Spikes: Many transient spikes occur at the voltage wave because of switching.
- Reflected Wave Voltage: Voltage applied to motor is reflected due to impedance difference of cable between motor and driver. The reflected voltage increases voltage

at motor terminals. Reflected wave voltage is especially important when cable between driver and electronic is too long.

- Additional Heating: Cooling performance of motor decreases as the speed of motor decreases. If the motor is loaded with same torque value, heating will be higher in the case of lower speed than higher speed.
- Bearing Current: An excessive voltage induced on rotor due to high switching frequency and transient voltage spikes. This induced voltage causes current flow on motor housing, end shields, bearing and shaft. Arcing caused by this current causes corrosion and damage on bearings.

Motors should be used under below condition to prevent above mentioned problems:

- Maximum length of the cable between driver and motor should be 5m.
- Motor housing must be grounded properly.
- $\Delta U/\Delta t$ filter should be used in required applications.
- Voltage drop between motor and inverter should not exceed 2%.
- Motor and driver specifications should match.
- Motor parameters should be defined to the drive correctly.
- Only one motor must be supplied with one driver.
- Peak value of voltage at motor terminals for given time should not exceed curve A for motors with rated voltage up to 500V and curve B for motors with rated voltage between 500V and 690V. Curve A and curve B are according to IEC 60034-25 and are given below.

Our standard motors are suitable for inverter applications for above conditions. Please contact with us for any variations.

VOLTAGE and FREQUENCY

ELECTRICAL PERFORMANCE VALUES	VOLTAGE (V)		FREQUENCY (Hz)	
	110%	90%	105%	95%
Starting and Rated Torque	1,21	0,81	0,95	1,11
Synchronous Speed	1	1	1,05	0,95
Rated Speed	1,01	0,98	1,05	0,95
% Slip	0,83	1,23	Slight change	Slight change
Slip at Full Load	1,01	0,985	1,05	0,95
Unloaded Operation Current	1,10 - 1,16	0,90 - 0,88	0,95 - 0,94	1,05 - 1,06
Starting Current	1,10 - 1,12	0,90 - 0,88	0,95 - 0,94	1,05 - 1,06
Rated Current	0,93	1,11	Slightly decrease	Slightly increase
Temperature Increase	0,97 - 0,96	1,06 - 1,07	Slightly decrease	Slightly increase
Overload Operation capacity	1,21	0,81	Slightly decrease	Slightly increase
Magnetic Noise	Slightly increase	Slightly decrease	Slightly decrease	Slightly increase
Rated Efficiency	1,05 - 1,1	0,985	Slightly increase	Slightly decrease
Power Factor ($\cos\phi$)	0,97	1,01	Slightly increase	Slightly decrease

TABLE 12: Effects of Voltage and Frequency Changes over Motor Performance

Our single-phase motors are manufactured in 230 Volt rated voltage and 50 Hz frequency. Our three-phase motors are manufactured in 400 Volt rated voltage and 50 Hz frequency. Manufacturing can be done based on 480V-660 V and 50-60Hz frequency upon special request. $\pm 5\%$ changes in rated voltage and $\pm 2\%$ changes in rated frequency do not cause significant changes in motor power.

The temperature value of the motors continuously operating in lower and upper limit values of permissible voltage values can exceed maximum temperature increase value by 10 K.

We can see the effects of $\pm 10\%$ change in rated voltage and $\pm 5\%$ change in rated frequency over motor's electrical frequency in Table 12.

Magnetic flux density decreases when the frequency increases without a change in the voltage. The magnetic flux density increases when the frequency increases. The motor reaches saturation when the magnetic flux increases. The motor's rotational torque is proportional with the square of motor magnetic flux density. Motor power is the multiplication of rotation speed and torque. Thus, motor power changes with speed and torque value.

Motors are manufactured appropriate to their rated voltage and rated frequency. Volt Electric manufactures motors with different voltage and frequency values by special order.

Motors manufactured according to 50 Hz rated frequency can practically be used at 60 Hz Frequency. However,

increase in frequency causes change in speed and torque. When the motor voltage changes with frequency, then the motor power changes as well.

Motors manufactured to operate at rated frequency of 50Hz can be used in 60Hz. The working conditions are shown in Table 13.

Rated Voltage V	60 Hz				
	50 Hz	Network Voltage V	rpm	Rated Power V	Rated Torque Nm
220	220	1,20	1,00	0,83	1,00
	240	1,20	1,10	0,91	1,00
	380	1,20	1,00	0,83	1,00
	400	1,20	1,05	0,87	1,00
	415	1,20	1,09	0,91	1,00
	440	1,20	1,15	0,96	1,00
	460	1,20	1,20	1,00	1,00

500	660	1,20	1,00	0,83	1,00
	660	1,20	1,00	0,83	1,00
660	660	1,20	1,00	0,83	1,00

TABLE 13: Performance values of motor which is produced for 50 Hz at 60 Hz operation

Motors are manufactured according to their rated voltage and rated frequency. Volt Electric phase motors are manufactured according to 380V and 400V 50 Hz, which is the network voltage in Turkey. However, standard voltage and frequency values change according to countries.

Volt Electric manufactures motors with different voltage and frequency values according to special orders.

Motors which are manufactured according to 50 Hz rated frequency can practically be used at 60 Hz frequency. However, increases in frequency causes change in speed and torque. If motor voltage changes with frequency, motor power also changes.

Factors for finding estimated operational changes, which can be seen in motor operational characteristics for the motors that are manufactured to operate at 50 Hz at network, and which will be used in 60 Hz and different network voltages, are given in Table 13.

Classification of Bearings:

Bearings are separated into two groups according to their rolling elements: ball bearings and roller bearings. Bearings are also separated as axial bearings and radial bearings based on the carried load.

Ball bearings are generally used in small types of electrical motors and these bearings carry load in a radial direction.

Bearing Space:

When one of the internal or external rings of a bearing is fixed, the other ring moves in a radial or axial direction. Bearing spaces are considered in radial and axial direction. Bearings should be embedded to their houses as carefully as possible. Radial space in used bearings is permitted in certain limits. Several criteria are considered for obtaining these working conditions. Different thermal expansions in bearing rings and connected parts cause crick-in bearing. A close fit decreases bearing space. Generally, the working space is smaller than the bearing space. Space of uninstalled bearing should be selected according to different working conditions and application tolerances. Therefore, there are smaller and greater spaced bearings in addition to normal spaced bearings.

In electrical motor production, manufacturers can limit bearing radial spaces according to shaft dimensional tolerances. The aim is to increase longevity and maximize efficiency.

Bearing Fitting and House Sensitivity:

When bearing housing and shaft are designed, it should be provided that bearing should fit on shaft and house with enough closeness. Generally, bearing's internal and external rings do not rotate at the same time. Principally, the ring which rotates should fit closely to house and the ring, which does not rotate should there be space. For an electrical motor, rotor shaft should fit closely with bearing ring. Ratio of this closeness is limited with bearing space. This aspect should be considered in bearing changes if an extra operation is performed in shaft.

Bearing Lubrication:

Lubrication should be used to prevent direct contact between balls and rolling paths and to prevent abrasion in surfaces for reliable operation of bearings. Greases, liquid or solid lubricants can be used for bearing lubrication. Lubrication reduces friction, therefore preventing abrasion and corrosion. Lubricants can also help with cooling and impermeability. Generally lubricants in electrical motors are greases.

Bearing Mounting/Dismounting and Maintenance:

Parts should be measured before mounting of bearing begins. The main principal in measurement is that part and

measurement device should be the same temperature. Micrometer is used for measurement of shaft's internal and external radius and hole micrometer should be used for measurement of hole diameters. A diameter should be normally measured at least in two sections and more than one plane.

Mounting environment should be very clean and smooth. After acquiring necessary measurement devices, tools are brought to mounting area; mounting order is determined and then bearing is taken from its package. If possible the bearings are held with gloves instead of bare hands--corrosion, which may be caused by sweat, can be prevented.

Bearing Mounting:

Major aspects to be considered in bearing mounting:

- Never hit bearing with a hammer. Use press and mounting apparatus if possible.
- Ring which will fit with close fit is mounted first. Mounting force is always applied through mounted ring. Thus, if internal ring is mounted over shaft, force is applied from the side of internal ring.
- Necessary radial and axial space should be controlled after mounting is completed.

If the mounting is performed according to instructions, bearing should run silently and normally. For example, irregular, scrabble-like sounds and vibrations mean that there is dirt in the bearing. More tough and boom-like sound is evidence that there is deficiency in rolling paths and bearing elements. Regular metallic and shrill sounds mean that there is not enough grease or lubricants in rolling paths. Operating bearings without lubricant can cause breakdowns in a short time. If bearing's temperature rises in a very short time period, this will mean there is a fault in the mounting and lubrication system. Therefore, it should immediately be dismounted and controlled.

Mounting methods are divided into mechanical, hydraulic, and thermal according to how much force is needed to be applied.

Mechanical mounting is generally applied in bearings having a hole diameter less than 100 mm. If mechanical force is applied by hammer, bearing should be hit with bushing (which is prepared by soft alloy or a support). Bushing or support should contact with rings only and with the cage or bearing elements. Hole and external diameter of bushing should be processed such that it is slightly smaller than wall thickness of bearing ring where mounting force is transmitted. Ring flank face should be pushed up so it stands to shaft rabbet or an intermediate part while bearing is mounted. Ring which is made with closed fit should be fixed against axial standing.

Bearing Dismounting:

You should work carefully and with appropriate tools while dismounting the bearing. The bearing should not be hit with a hammer when it is mounted. Generally, the dismounting process requires more force than the mounting process. Yet, force should not be applied through the cage or bearing components in the process of dismounting.

Bearing Cleaning:

Polluted bearings or bearings that are dismounted after usage for maintenance should be cleaned carefully by gas oil and brush and should be washed and cleaned in at least two separate baths: one for washing and one for cleaning. For controlling the result of this cleaning process, the bearing has to be oiled with thin oil and rotated by hand. There should not be any irregular noise or roughness. Cleaned bearing should be lubricated with suitable grease or oil. Bearings should be packaged to prevent dust and dirt.

Closed bearings are checked and if they are not suitable for usage they have to be disposed. Suitable ones are cleaned and packaged.

Cylindrical Roller Bearings Construction:

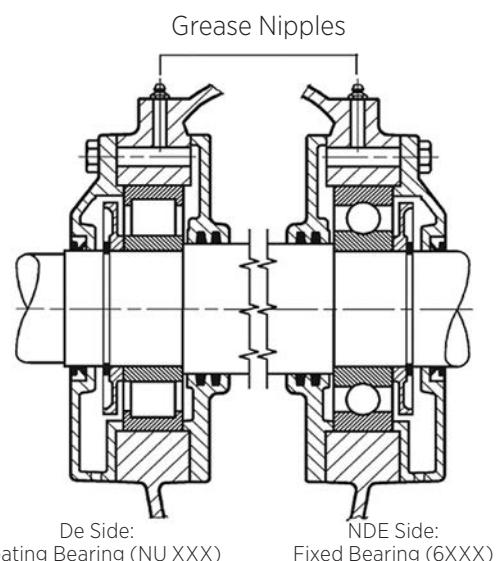

FIGURE 21: Construction of bearings.

For the application with high radial load and there is rapid changes in speed and high speeds, cylindrical roller bearings are used. These kind of bearings have more load carry capacity than ball bearings.

For special applications on 200 Frame and upper-size motors, please contact us.

BEARINGS THAT ARE USED in SINGLE-PHASE MOTORS

Fixed-ball bearing, whose both sides are closed (ZZ), are used in motors with frame sizes 63-132 (Figure 22) as well as frame sizes 160-225 (Figure 22).

In some cases construction can be made (as seen in Figure 23) for preventing axial movement of shaft with respect to some applications in frame sizes 63-132.

Rubber dust gaskets (V-ring) are placed in front and rear covers. Oil seal can be placed upon on request.

TERMINAL CONNECTIONS

STATOR WINDING	STANDARD TERMINAL MARKING	TERMINAL CABLE COLORS
Main Winding	U1-U2	Black-Blue
Auxiliary Winding	Z1-Z2	White-Red

TABLE 25: Terminal connection for standard single-phase asynchronous motor.

Terminal Connection Standard Single-Phase Asynchronous Motor

The coding that Volt Electric Motors applies for the main windings and auxiliary windings that form the stator windings are shown in Table 25.

Main winding's (Black-Blue) endings are connected to U1 and U2 terminals in terminal table and auxiliary windings (White-Red) endings are connected to Z1 and Z2 terminals.

TERMINAL CONNECTION for CAPACITOR RUN SINGLE-PHASE MOTOR

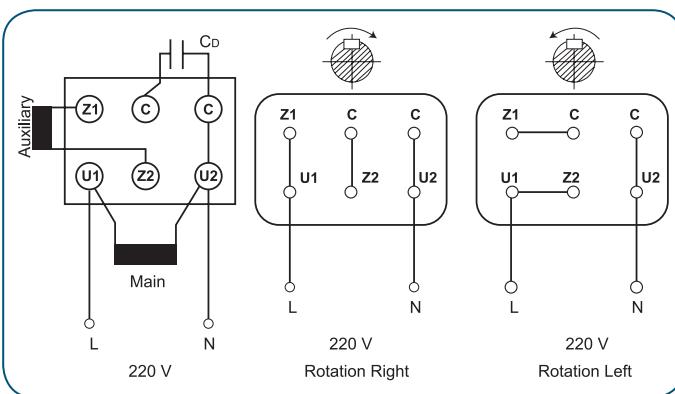

FIGURE 26.

Changing the rotation direction in capacitor run single-phase asynchronous motors with run capacitor:

To change the direction of rotation in one-phase asynchronous motors, it is necessary to change the direction of current in main windings or auxiliary windings. If the direction of current in auxiliary winding or main winding is changed, the direction of magnetic field also changes.

Motor terminal table connection and motor rotation direction of permanent capacitor asynchronous motor is given in Figure... Meaning of rotation right and rotation left is as follows:

Rotation Right: When you look at motor drive's shaft end the direction of rotation is clockwise.

Rotation Left: When you look at motor drive's shaft end the direction of rotation is counter clockwise.

TERMINAL CONNECTION for CAPACITOR START and CAPACITOR RUN SINGLE-PHASE MOTOR

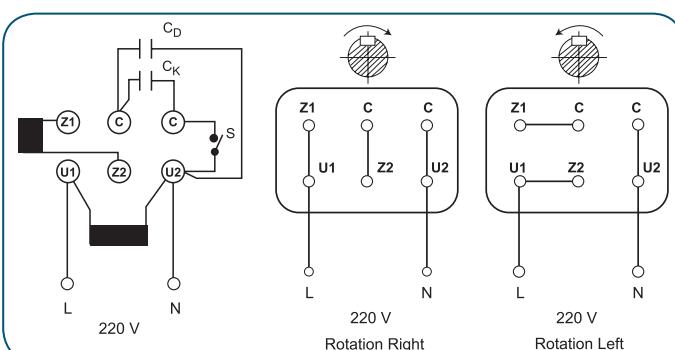

FIGURE 27.

Volt Electric Motor's single one-phase asynchronous motor terminal table connections rotate left (jumps are in horizontal position). If the motor rotates in reverse direction, the jump between U1-Z2 will be taken between U1-Z1 and the jump between Z1-C shall be taken to C-Z2 (jumps at vertical position). Line connections (L-N) will always be connected at motor's U1-U2 terminals.

TERMINAL CONNECTION for THREE-PHASE ASYNCHRONOUS MOTORS

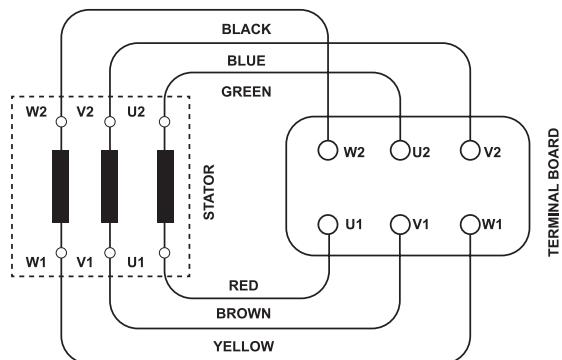

FIGURE 28: Connection of stator winding ends to the terminal table

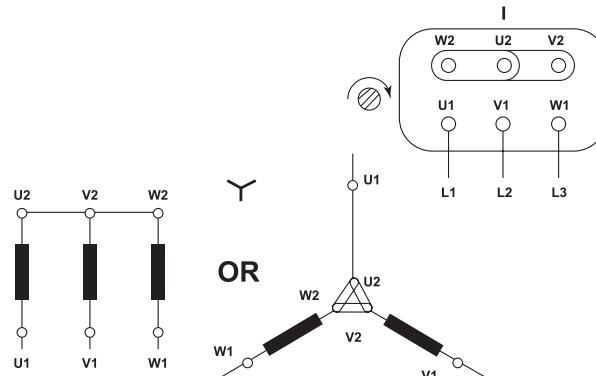

FIGURE 29: Star(Y) connection of stator winding ends

Connection of Stator Winding Ends to the Terminal Table:

Connection of stator's three-phase windings to the motor's terminal table is shown in Figure 28. In this connection, input terminals are connected to terminal table (U1, V1, W1) with same order and output endings are cross connected to other terminals U2, V2, W2. Volt Electric Motors codes its stator phase windings input and output terminals with colored cables. Also, terminal connection screws in terminals are marked with standard letters. This coding makes terminal connection and determination of winding endings easier. Cables' color codes are shown in Figure 28.

Star (Y) Connection Between Phases of Stator:

Motor stator windings are connected as star or delta in three-phase asynchronous motors. Volt Electric Motors up to 3 kw motors (included) in 2 and 4 poles and up to 2.2 kW (Included) for 6 poles are connected as a star in 400 V network. As shown above, star connection is obtained by combining the stator winding output endings. U2, V2, W2 terminals are joined for star connection. Three-phase network (L1, L2, L3) are connected to U1, V1, W1 terminals.

STATOR WINDING DELTA (Δ) CONNECTION BETWEEN PHASES

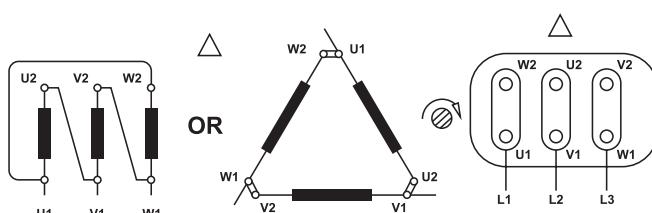

FIGURE 30: Delta connection (Δ) of Stator winding ends

Delta connection is obtained by joining phase winding's output endings with other phase winding's input endings. As it can be seen in Figure 30, corresponding endings in motor terminals are combined with jumps, therefore delta connection is obtained.

If a motor, which should be operated with (Y) 400 V in three-phase network, is mistakenly connected with (Δ) and operated, then $\sqrt{3}$ fold of voltage is applied to phase windings. Although motor phase windings voltage is 230V, 380 V is applied. If phase current, which passes through motor windings, increase $\sqrt{3}$ fold (similar to voltage), then motor is in breakdown risk.

If a motor which should be operated (Δ) 380 V at three-phase network is operated (Y) connected in same network; voltage, which is applied to windings, reduces to $1/\sqrt{3} = 0,58$ value (220V). Motor works under low voltage. Since power and torque will reduce, motor cannot be loaded with nameplate power.

STAR (Y) AND DELTA (Δ) CONNECTION METHODS OF VOLT ELECTRIC MOTORS

POLE NUMBER (2P)	STAR (Y) CONNECTION 380V(Y) - 400V(Y) (50Hz)	DELTA (Δ) CONNECTION 380V (Δ) - 400V (Δ) (50Hz)
2 AND 4	$P_{MOTOR} \leq 3 \text{ kW}$	$P_{MOTOR} > 3 \text{ kW}$
6	$P_{MOTOR} \leq 2,2 \text{ kW}$	$P_{MOTOR} > 2,2 \text{ kW}$

TABLE 26: (Y) and (Δ) connection methods

TERMINAL CONNECTION for TWO-SPEED ASYNCHRONOUS MOTORS

Revolution number of asynchronous motors depends on pole number of stator windings and frequency of applied voltage. If frequency is fixed; different revolution is obtained by different windings having different number of poles or connection which is made by different number of poles in same winding. Accordingly, we can think of two-speed motors being in two groups:

- Two separate two-speed motors
- One winding two-speed motor

If two separate independent windings having different number of poles are wound into same stator slots, two winding, two-speed motor is obtained. In this type of motor, speed according to pole number of the winding is obtained depending on which winding is applied with three-phase voltage. Windings star (Y) or delta (Δ) connection is made inside the stator in this kind of winding. Three ending for each winding is brought to the terminal table. For example, 6-pole winding endings for 6/4 pole, two winding two-speed motor is 6U-6V-6W and 4U-4V-4W for 4-pole winding endings, respectively.

Two winding two-speed motors are not economical. Because two separate windings are placed into slots which are considered for one winding. Therefore less power is obtained with respect to one winding two-speed motors. In other words you can obtain more power with one winding two-speed motors with respect to two separate winding two-speed motor.

Production of two winding two-speed motors is limited since they are not economical. They are applied for pole numbers which are not folds of each other since their connection and design are easier.

One winding two-speed motors are considered in two groups.

2.1 Dahlander winding motors

2.2 PAM winding motors

2.1 Dahlander Winding Motors:

Their design and connection is easy. But pole number ratio in this connection type is 2/1, thus 4/2 or 8/4 poles. If a connection which provides different pole numbers which are fold of each other in a winding; this connection is called "Dahlander Connection" and these kinds of motors are called "Dahlander winding motors". Winding in Dahlander connection is designed according to lower revolution number, thus bigger pole number. Medium endings of each phase windings are found. Phase winding input endings are marked as 1U-1V-1W and medium endings are marked as 2U-2V-2W Six ending are brought into terminal table.

Dahlander Motor Terminal Connection:

Dahlander motor connected winding endings are connected in terminal table as follows:

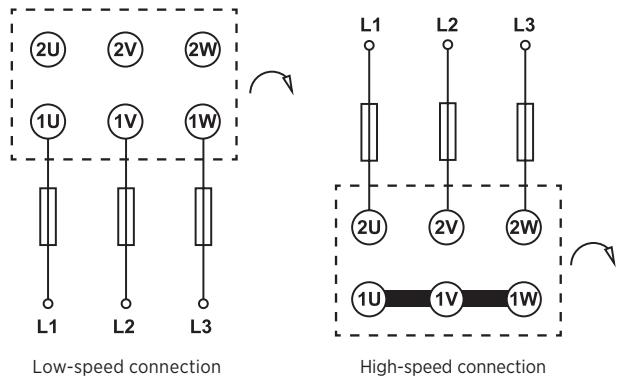

FIGURE 31: Terminal table and two different speed connection in Dahlander winding

In Dahlander connection rotation of both speeds of motor should be same direction as it can be seen in Figure . For providing same rotation direction and to connect 2U-2V-2W terminals in terminal table with same order, there should be change in two phases in medium endings of phase groups. For example, 2W should be connected instead of 2U which is the medium ending of first phase ending 1U and connection 2U instead of 2W which is the medium ending of third phase 1W. If this change is made, motor which is shown in Figure 31 will rotate in same direction for both speeds.

Dahlander winding motors are complete mold winding systems. Half-mold winding applications cause powerful harmonics in bigger pole number (low speed) operation and these harmonics may have bad effects related to motor starting. Therefore, half-mold Dahlander windings are not used.

Volt Electric Dahlander winding motors are full-mold winding. Motors have 4/2 or 8/4 poles. Phase windings are (Δ) connected inside stator. When three-phase voltage is applied to phase winding input endings (1U-1V-1W), windings are serially delta connected and low speed is provided by bigger pole number. 1U-1V-1W endings are jumped medium endings of phase windings (2U-2V-2W) they are parallel star connected and motor rotates with lower pole number and higher speed.

TERMINAL CONNECTION for TWO-SPEED ASYNCHRONOUS MOTORS

Serial Delta- Parallel Star Connection (Δ -YY) Connection and Winding Schema:

This is the most applied connection in Dahlander winding motors. Motor power and current changes in both speed. Power is greater in high speed. It is used in pumps with piston, compressors, band conveyors and in many similar places. Volt Electric Dahlander winding Δ motors are Δ / YY connected.

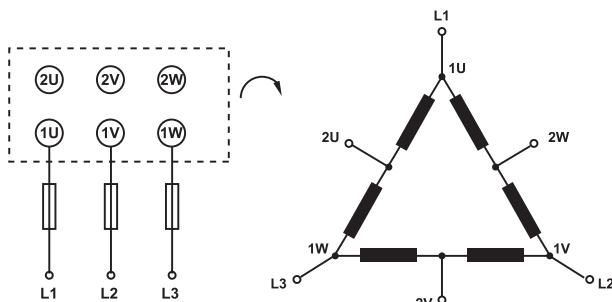

FIGURE 32: 2P=4 Poles, delta wiring in series for low speed

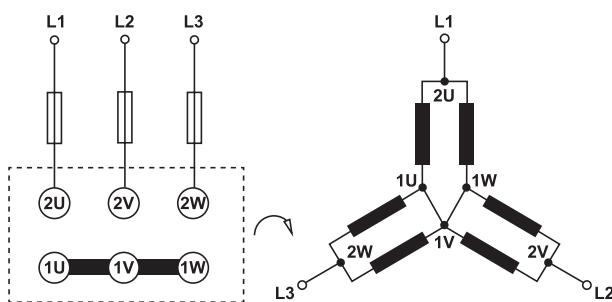

FIGURE 33: 2P=2 poles, star wiring in parallel for high speed

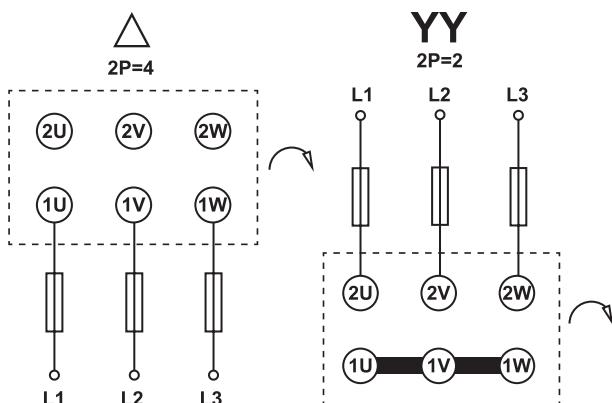

FIGURE 34: 4/2 poles, Δ / YY Dahlander winding connection

Serial Star – Parallel Star (Y-YY) Connection and Winding Schema:

This is another connection which is applied in Dahlander winding motors. Each phase group connection's output endings are combined in stator and star (Y) connection is obtained. Motor power and torque proportionally changes with revolution in this connection. Motors having serial star parallel star (Y/YY) connection motors are called different torque Dahlander winding motors. This connection is preferred in ventilators, blowers, centrifugal pumps, and similar place drives.

SPECIAL PURPOSE MOTORS

SINGLE-PHASE ASYNCHRONOUS PUMP MOTORS - THREE-PHASE ASYNCHRONOUS PUMP MOTORS Aluminum housing

SINGLE-PHASE ASYNCHRONOUS PUMP MOTORS	
Motor output power	0,37 - 1,5 kW, 2 Poles
Frame size and case materials	71 - 90 Aluminum housing with run capacitors 80 - 90 Aluminum housing with start and run capacitor
Rated voltage	230 V, 50 Hz - 400 V, 50 Hz
Construction and Mounting	Table: 21
Degree of protection of motor enclosures (IP)	IP 55 is standard, IP 56, IP 65 and IP 66 are optional
Isolation Class	F Class
Temperature rise	B Class
Duty type	S1
Maximum ambient temperature	40°C
Altitude of installation	Up to 1000 meters
Rotor material	Aluminum die cast
Cooling methods	IC 411
Bearings	Table: 17
Terminal box location	On top of the motor at ND-End
Terminal box material	Table: 15
Mounting of fan cover	With bolt
Fan cover material	Stainless metal sheet, Table:
Thermal protection (PTC Thermistor, Micro thermostat)	Optional
Paint	Gray RAL 7031
Foot type (fixed foot, removable foot, without foot)	Table: 21

Rated voltage	220 V, 50 Hz
Construction and Mounting	Table: 21
Degree of protection of motor enclosures (IP)	IP 55 is standard, IP 56, IP 65 and IP 66 are optional
Isolation Class	F Class
Temperature rise	B Class
Duty type	S1
Maximum ambient temperature	40°C
Altitude of installation	Up to 1000 meters
Rotor material	Aluminum die cast
Cooling methods	IC 411
Bearings	Table: 17
Terminal box location	On top of the motor at ND-End
Terminal box material	Table: 15
Mounting of fan cover	With bolt
Fan cover material	Stainless metal sheet, Table:
Thermal protection (PTC Thermistor,Micro thermostat)	Optional
Paint	Gray RAL 7031
Foot type (fixed foot, removable foot, without foot)	Table: 21

SPECIAL PURPOSE MOTORS

THREE-PHASE ASYNCHRONOUS MOTORS with ELECTROMAGNETIC BRAKING

Aluminum housing

THREE-PHASE ASYNCHRONOUS MOTORS WITH ELECTROMAGNETIC BRAKE

Motor output power	0,25 - 4 kW, 4 poles
Frame size and case materials	Aluminum housing: 71 - 112
Rated voltage	380/660 V and 400/690 V 50 Hz
Brake voltage	24 VDC or 98 VDC on request
Construction and Mounting	Table: 21
Degree of protection of motor enclosures (IP)	IP 55 is standard, IP 56, IP 65 and IP 66 are optional
Isolation Class	F Class
Temperature rise	B Class
Duty type	S1
Maximum ambient temperature	40°C
Altitude of installation	Up to 1000 meters
Rotor material	Aluminum die cast
Cooling methods	IC 411
Bearings	Table: 18
Terminal box location	On top of the motor at D-End
Terminal box material	Table: 15
Mounting of fan cover	With bolt
Fan cover material	Stainless metal sheet, Table:
Thermal protection (PTC Thermistor,Micro thermostat)	Optional
Paint	Gray RAL 7031
Foot type (fixed foot, removable foot, without foot)	Table: 21
